

Hario V60 Single Cup Coffee Brewing Method

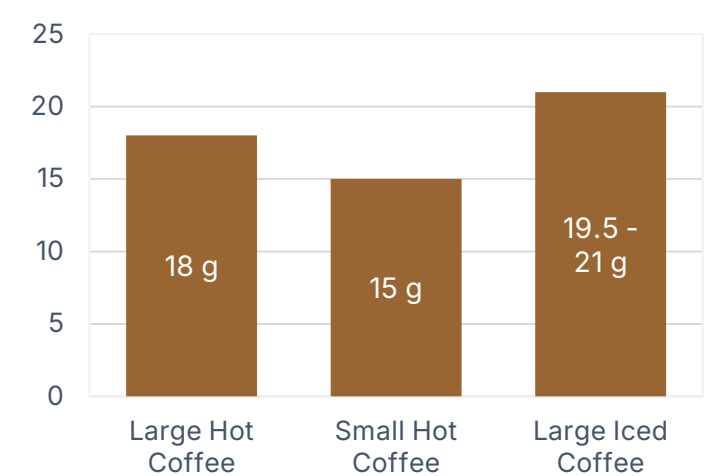

1. Measure Water

2. Set Kettle Temperature

3. Weigh Beans

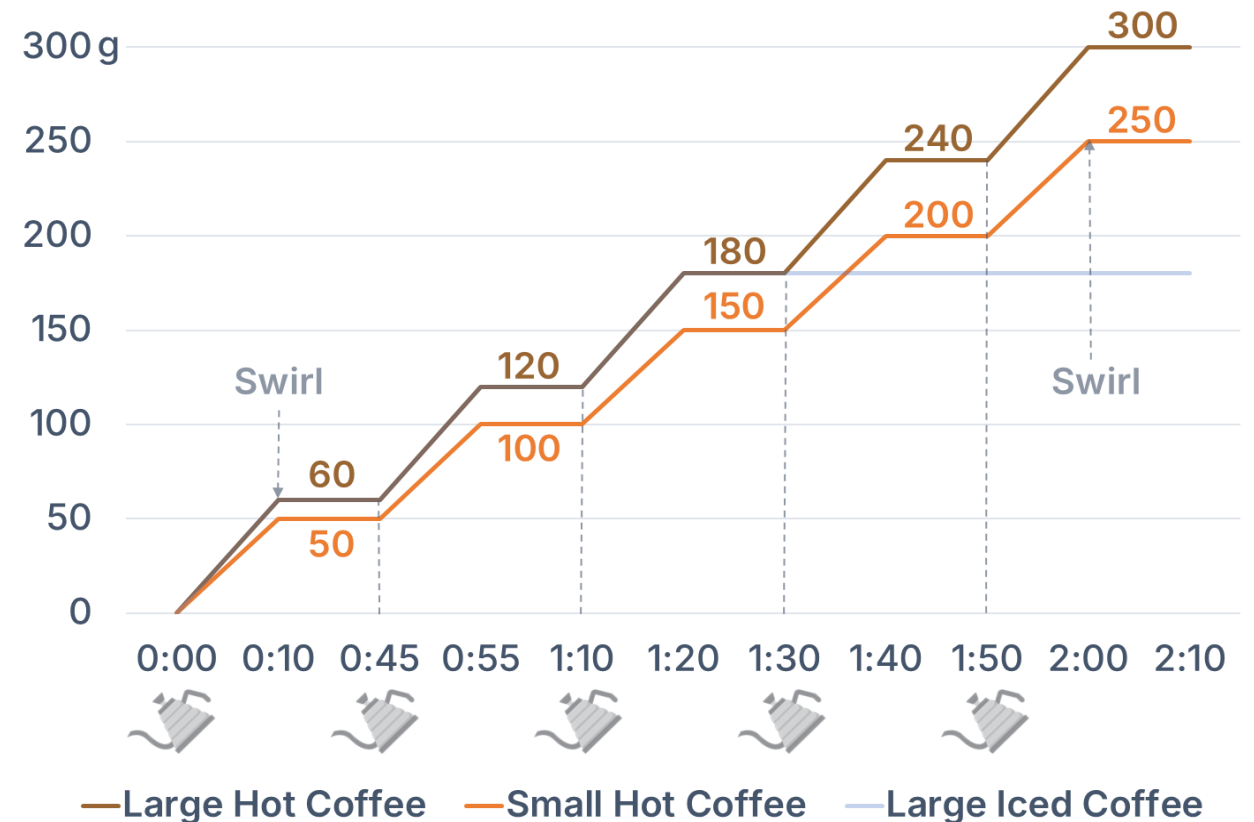

4. Grind beans to a medium fine.
5. Place a new white 01 filter into the dripper, rinse with hot tap water, allow to fully drain into a glass server. Shake and remove excess water from dripper, filter, and server.
6. Place dripper, filter, and server onto a precision scale.
7. Add ground coffee to the filter and shake the dripper to level. Make a little inverted "volcano" with your finger in the center of the grounds and zero the scale.
8. Start the timer and pour heated water from the kettle in a slow, circular motion for about 10 seconds at intervals shown in the **Brew** graphic. For example, if brewing a large hot coffee initially pour until the scale reads 60 grams then stop. Repeat the pour at 45s until 120 grams, 1:10 until 180 grams, 1:30 until 240 grams, and 1:50 until 300 grams.
 - **Swirl the dripper 3-4x in a circular motion after the first pour**
 - **Lightly swirl the dripper again 1-2x after the last pour**
9. Coffee should be fully drained in the server at about 3:10.

10. Troubleshooting

- **Coffee is too bitter**
 - Boil water at a lower temperature
 - Grind more coarsely
 - Swirl less aggressively
- **Coffee is too acidic**
 - Grind finer

8. Brew

- Time axis not to scale
- 0.1 g coffee $\approx$ 1.7 g H₂O
